

**5G ACTIVITIES IN BROADBAND WIRELESS TECHNOLOGIES LAB**

Benoit Miscopain, head of laboratory

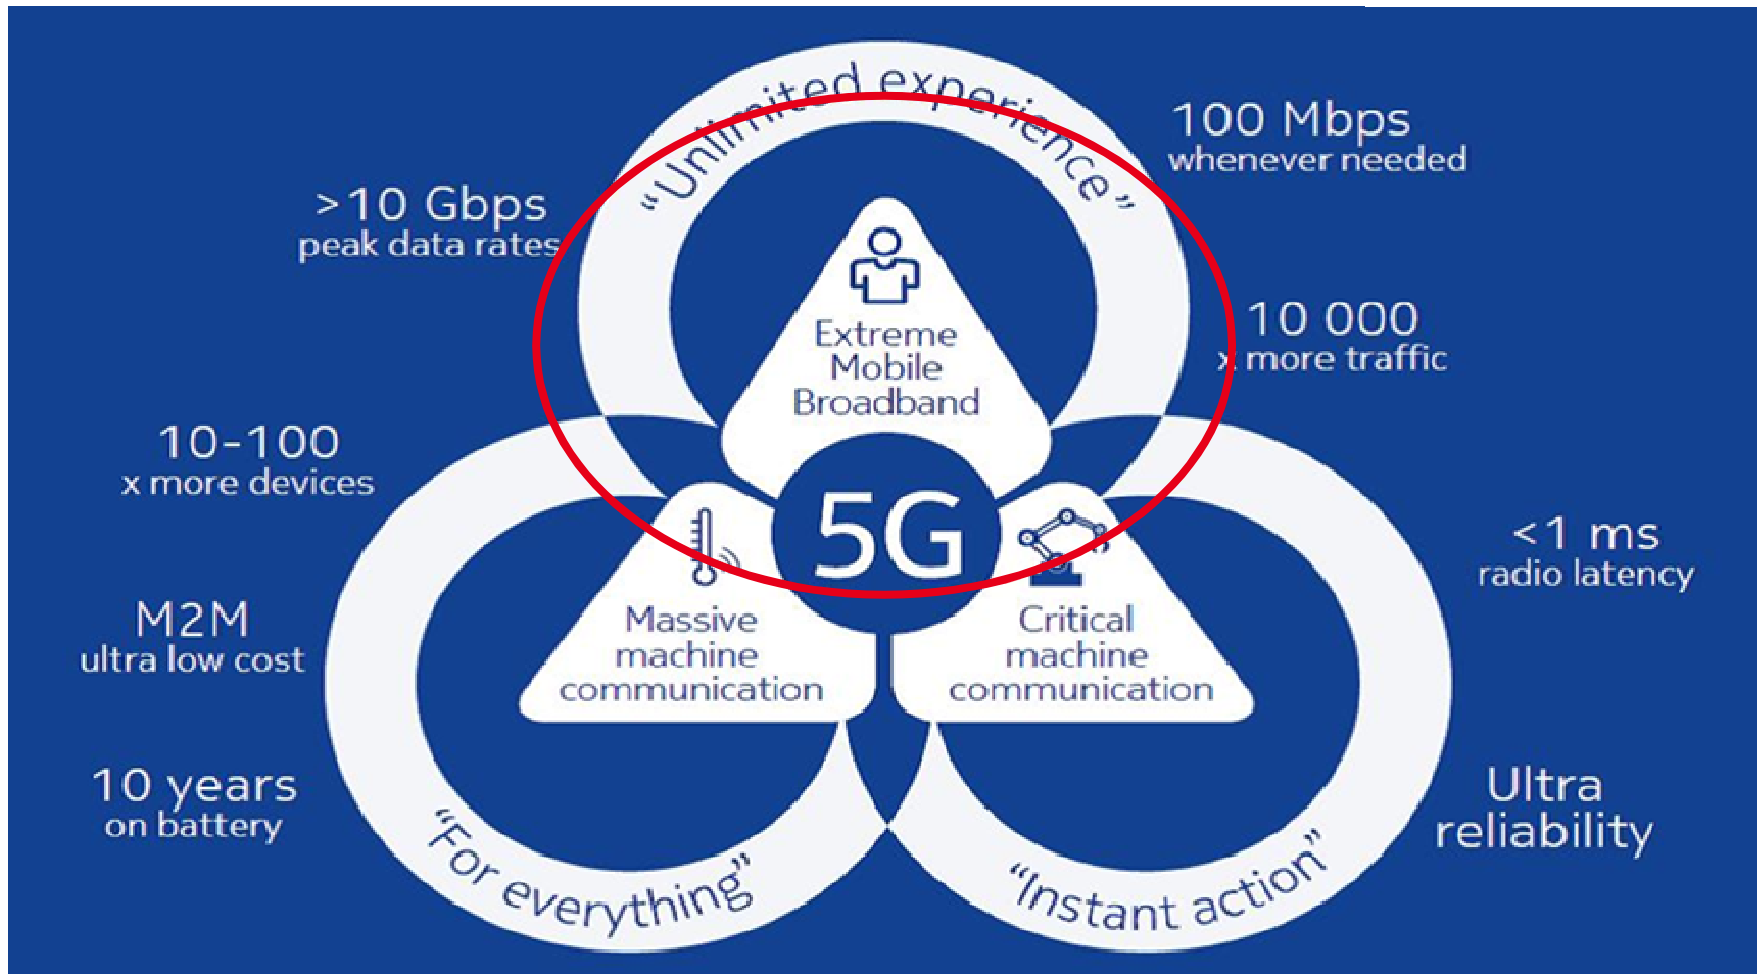

# LETI WIRELESS LABS APPROACH

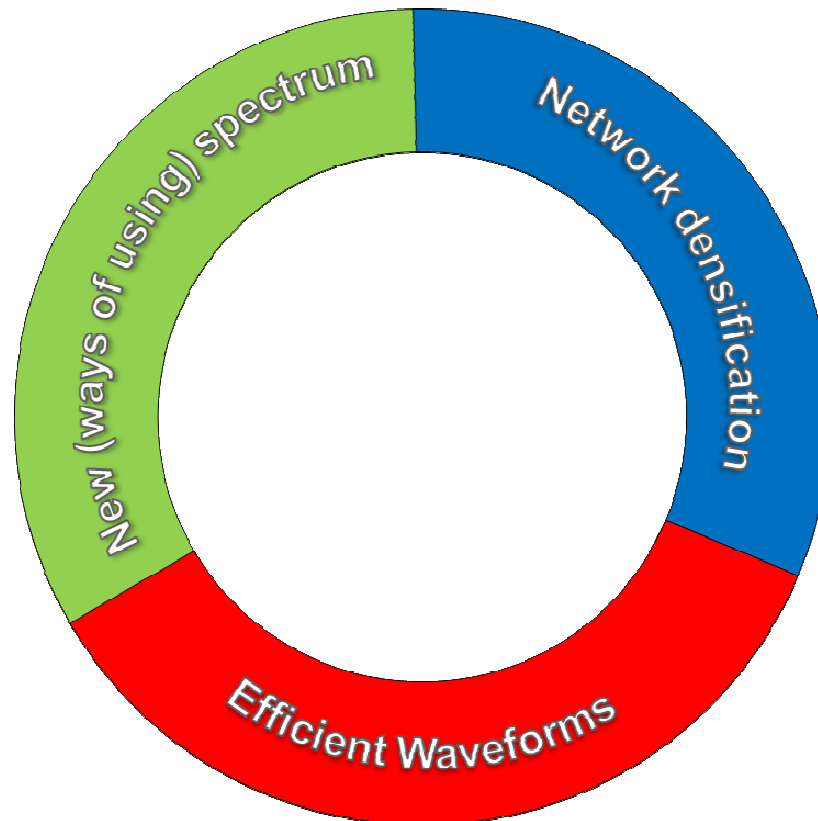

# CURRENT PLAYGROUND

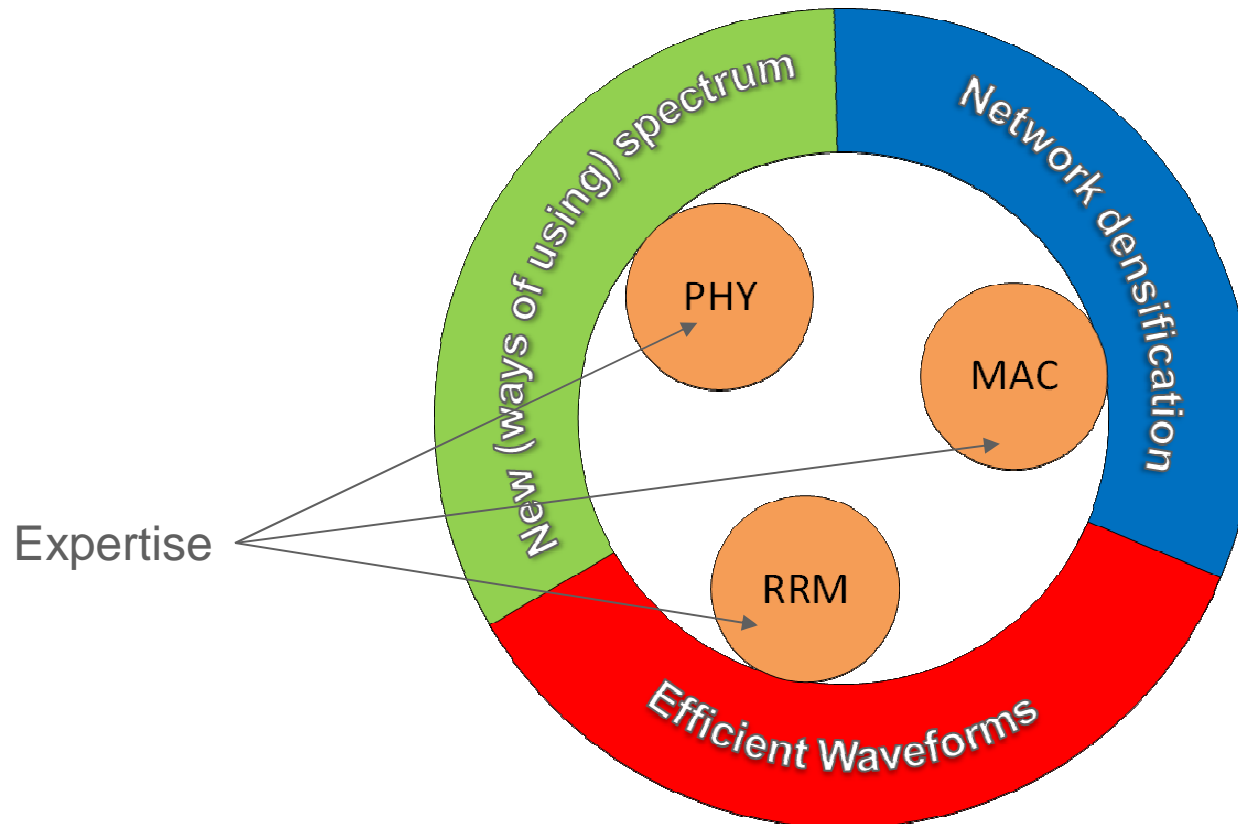

## APPROACH OF 5G IN CEA-LETI

- **Telco industry says that 5G capacity improvement can be obtained thanks to**
  - Efficient waveforms to maximise spectrum usage
  - Dense heterogeneous networks deployment
  - Need for new spectrum and new ways of accessing spectrum

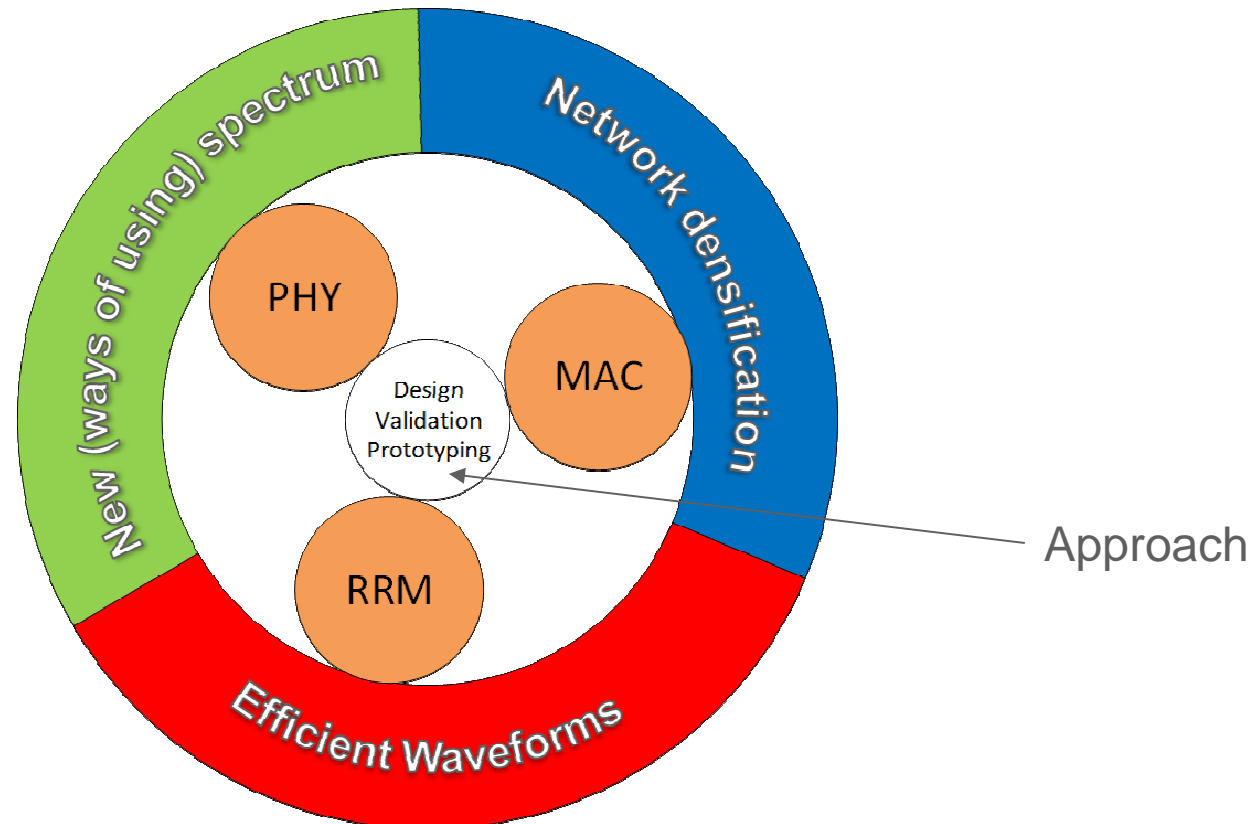

## APPROACH OF 5G IN CEA-LETI

- **Telco industry says that 5G capacity improvement can be obtained thanks to**
  - Efficient waveforms to maximise spectrum usage
  - Dense heterogeneous networks deployment
  - Need for new spectrum and new ways of accessing spectrum

## APPROACH OF 5G IN CEA-LETI

- **Telco industry says that 5G capacity improvement can be obtained thanks to**
  - Efficient waveforms to maximise spectrum usage
  - Dense heterogeneous networks deployment
  - Need for new spectrum and new ways of accessing spectrum

- **LETI has a long track record in post-OFDM PHY design**
  - FBMC (starting 2010) for secondary usage of spectrum chunks (TV-WS)
  - Recent work on 5G PHY with BF-OFDM ; ability to accommodate services of 5G coexisting in a single 20 MHz-carrier
    - **Block-Filtered OFDM**, rewarded as Best Paper of IEEE International Conference on Communication, in 2017

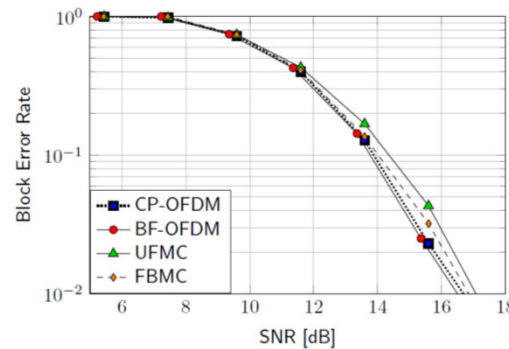

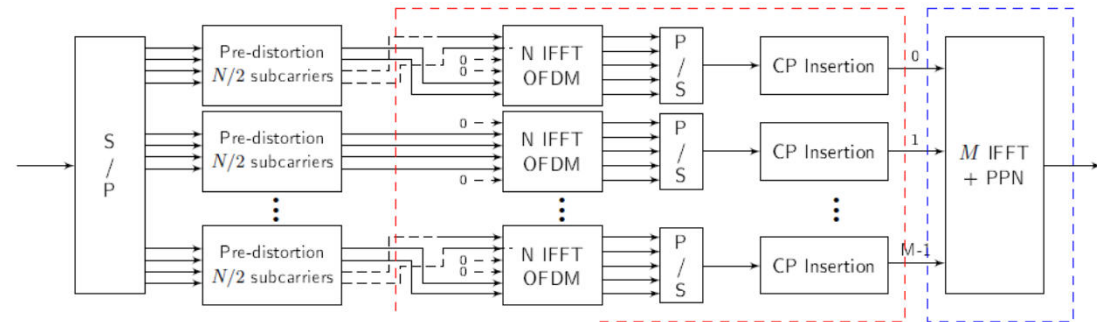

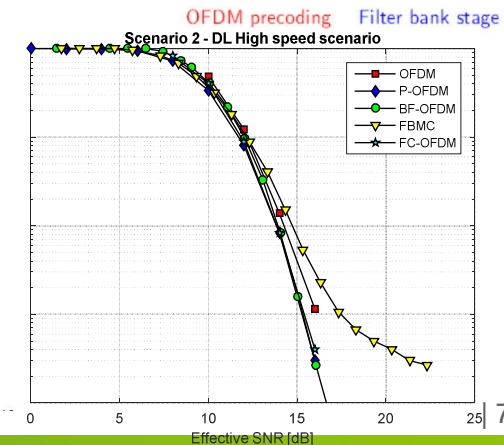

Figure 6: TDLC Channel Model (1000 ns) with speed of 3 km.h<sup>-1</sup>

- **BF-OFDM has been validated field trials on different scenarios**
  - 5G multi-service support on the same 20 MHz carrier
  - High speed rural internet (Scotland)

- **On-going work on low-latency support, wideband operation for satellite communications**

- Long term use for super high speed backhauling or offloading

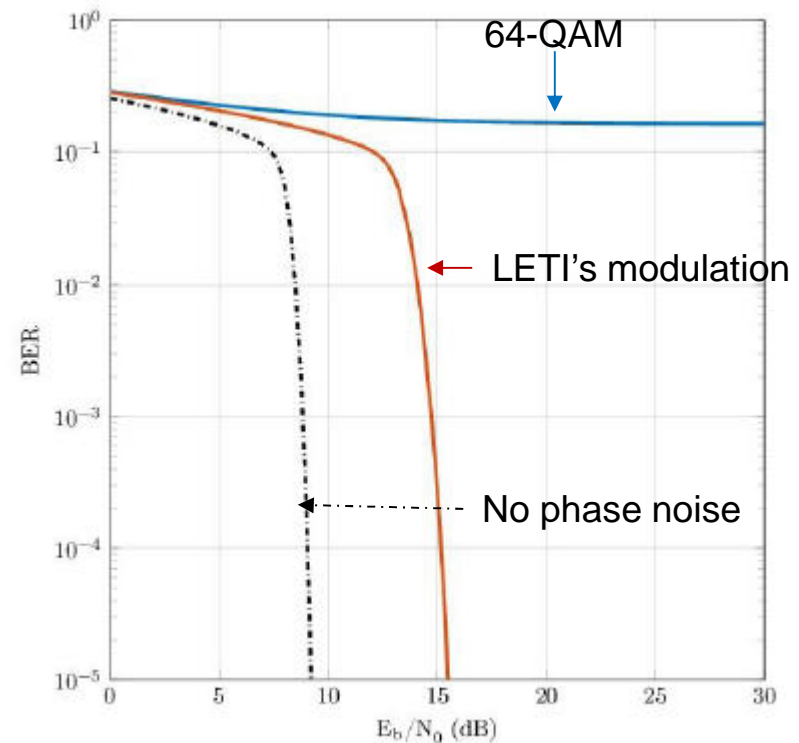

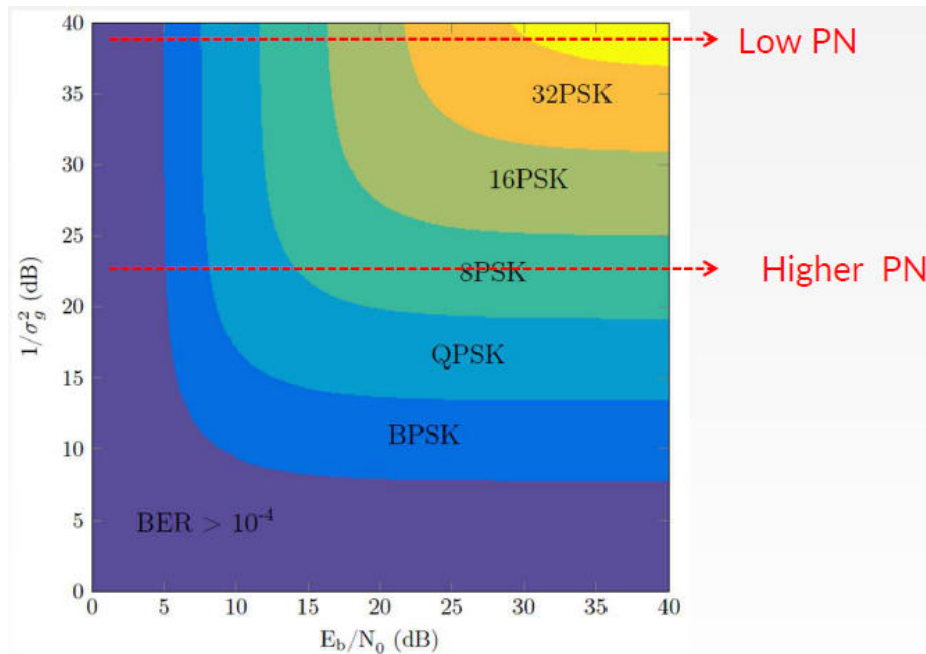

- Sub-THz channels are flat 
  - RF impairments may be dramatic (e.g. phase noise of oscillators) 
- 
- Question explored : design of waveform robust to RF impairments

- **Work status**

- Definition of a digital modulation robust to phase noise (**patent on-going**)
- Proposal of a link adaptation protocol to deal with various bands/noise levels (**patent on going**)

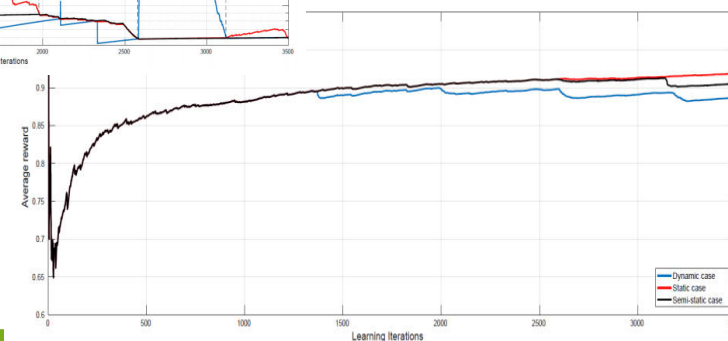

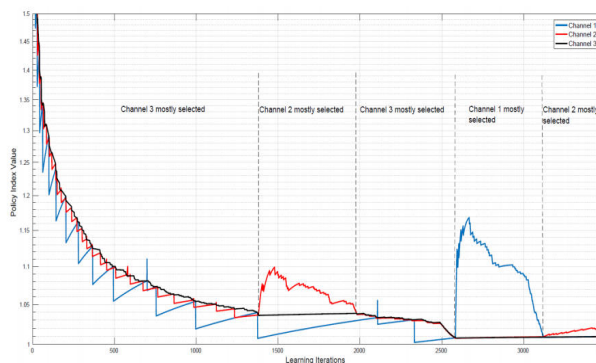

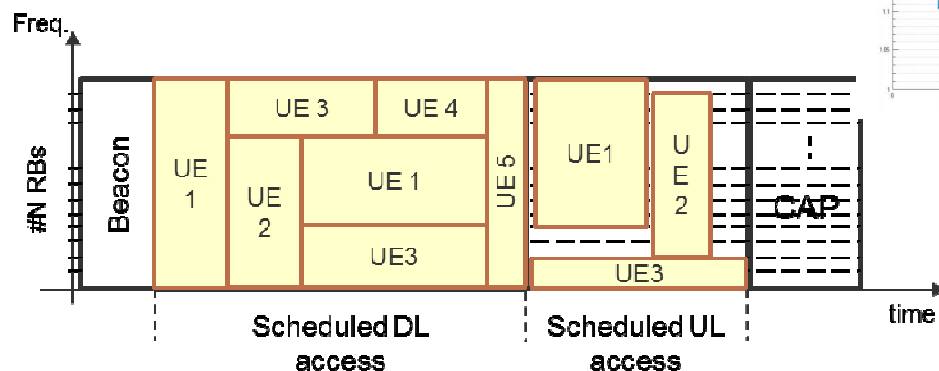

BER vs. SNR (w/ LPDC codes)

# MAC DESIGN FOR UNLICENSED OFFLOAD

- **MAC design for unlicensed operation targeting traffic offload**
  - Opportunistic access for non demanding QoS services (traffic offload)
  - Joint access in unlicensed and licensed spectrum (carrier aggregation)
- **Main features**
  - Support of broadband traffic and dense scenarios
  - Fair coexistence with others systems thanks to listen-before-talk (LBT)
  - Dynamic selection of the best channel with reinforcement learning

## MAC DESIGN FOR UNLICENSED OFFLOAD

- SPEED-5G public event in London (March)
- ICT 2018 conference in Saint-Malo (June)

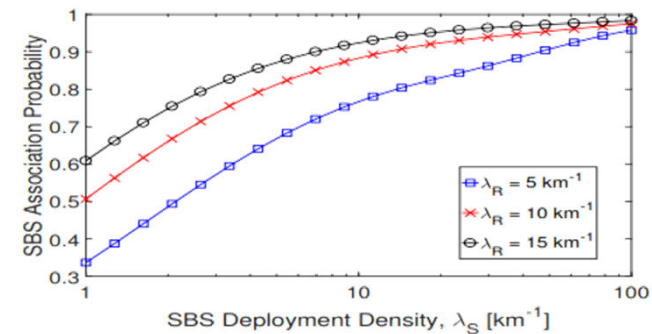

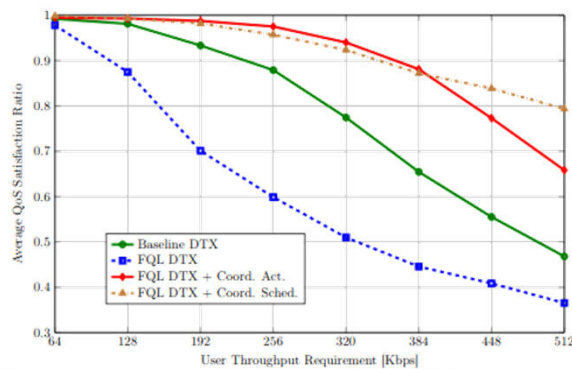

- Network capacity improved by deployment of small cells
  - Small cells may use the same resources than macro-cells or can be multi-RAT
  - Densification leads to unplanned interference varying in time and space

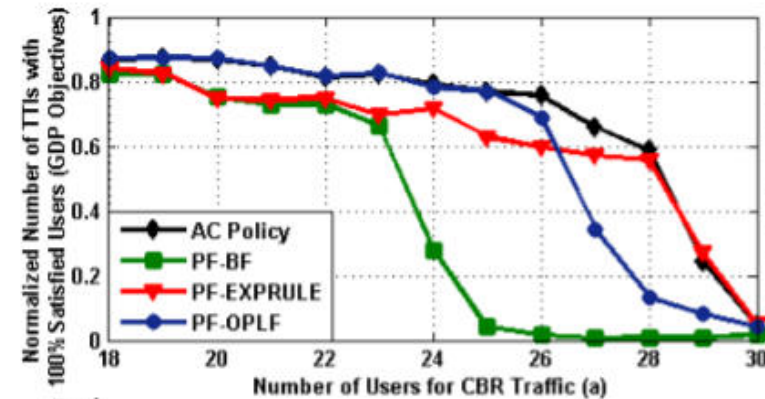

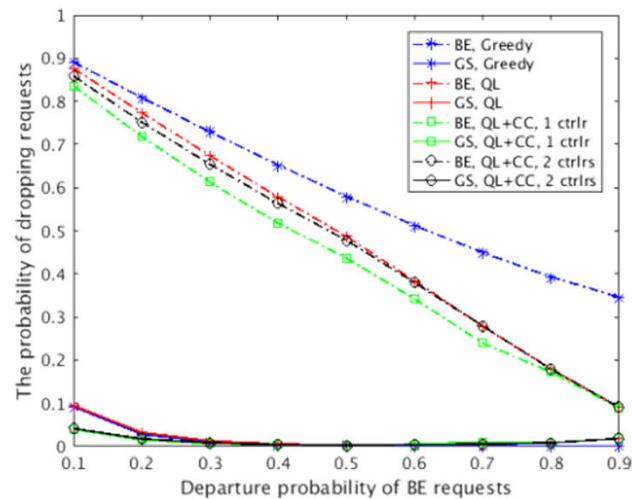

- Main focus in LETI: **RRM algorithms for interference management**
  - Simulations and analytical approaches for network/performance assessment. E.g. for
    - Small cell association strategy and/or traffic offload in multi-RAT hetnets
    - Inter-cell coordination for DTX, under QoS and RAN/backhaul consumption constraints

- Learning methods applied to radio, energy, and cloud resource optimization. E.g. for
  - Optimal scheduling policy for heterogeneous traffic
  - Slice Admission and Congestion Control
  - Dynamic deployment of Virtual Network Functions in cloud RAN
- System optimization based on artificial intelligence
  - Reinforcement learning for strategy design
  - Unsupervised learning for service classification and clustering
  - Neural Network, fuzzy logic, and tile coding as function approximators

- AI-based and learning based approaches are already used for RRM.
- Question: what AI can do for “beyond-5G” PHY/MAC design ?
  - Can auto-encoders approaches provide new PHY design paradigm?
    - Proved to be able to cope with linear conditions with limited gains
    - How does this fit with non linearities (RF, ADC, ...)

- **Get some updates during the LETI Innovation Days 2020**

## AND WE DIDN'T MENTION

- Hybrid beamforming for sub-6GHz small cells
- URLLC operation through multi-channel LBT operation
- Full-duplex
- 5G-NR satellite communications
- LIFI communications hybridization with 5G networks
- Custom HW/SW fast prototyping board design
- ...
